Software Testing: Automated Software Testing

Agile Fundamentals

PROJECT DETAILS

1-Project: Insurance domain

- Feature –Insurance claim software
- Skills Used - Manual Testing and Automation Testing
- Team Size – 05
- Methodology – Agile

Objectives: -

- 1.Validate data against the policy.
- 2.Captured specific data elements to facilitate integration.
- 3Automatic Multi-level Email notifications.
- 4.Escalating alerts for acknowledge loss report

2-Project: Transportation and Logistics domain

- Feature –BFLF (Balanced forward and late fee)
- Skills Used - Manual Testing, Automation Testing and API
- Team Size – 15
- Methodology – Agile

Description: The client is a renowned courier company. The project includes both manuals and automation testing. There are around 10 web- and window-based applications on which functional testing is conducted.

Responsibilities:

- Analyzing business requirements thoroughly to formulate comprehensive test scenarios, prepare relevant test data, and develop precise test cases.
- Demonstrating extensive proficiency in crafting and executing test cases, meticulously analyzing outcomes, and effectively documenting identified defects.
- Collaborating closely with the application team to address any impediments hindering the application's progress.
- Assuming responsibility for conducting integration testing, functional testing, smoke testing, and regression testing to ensure software reliability and stability.
- Validating data integrity using SQL queries within the database environment.
- Efficiently managing the compilation of Daily Status Reports to provide stakeholders with transparent project updates.
- Diligently reporting identified bugs and actively coordinating with the application team to facilitate timely bug resolution.
- Actively participating in test case review meetings to ensure alignment with project objectives and quality standards
